

TAGIOFI · Product Overview

Your tag knows what you want to be paid in.

\$TGIO · Robinhood Chain (4663) · Non-custodial · Tag-native payment settlement for real-world assets Infranodes · Confidential

0. One line

On TagioFi, your payment tag carries your preferences. Tell your tag once — “I take 60% SPY, 30% USDG, 10% gold” — and every payment that hits it arrives converted: the tip, the invoice, the salary, the split. Senders send anything; your tag makes sure what lands is what you’d actually keep. Stop receiving money you immediately have to convert. Start receiving the portfolio.

1. The opening (deep-researched, Aug 2026)

- Institutions just proved people want this: the first RWA payroll pilot (Plume × Toku × WisdomTree) let staff take salary in a tokenized money-market fund — but it’s a closed program: one employer, one fund, verified wallets, a payroll vendor in the middle.
- Wallets solved the *buy* side (MetaMask × Ondo: swap into 200+ tokenized assets). The *receive* side — payments that arrive as the asset you want — doesn’t exist anywhere, for anyone.
- Robinhood Chain is the only venue where this is trivial to make real: tokenized stocks are native tokens with live Chainlink pricing, and the chain carries an **on-chain tag registry** (NFT-registered payment tags whose resolver exposes a destination, programmable splits, and a preferred-settlement-asset field that today sits unused). TagioFi is the machine that makes that preference field mean something.
- Everything “stocks” on RHC today is hold-to-earn fee drip. Actual payments — commerce, invoicing, payroll — settle in whatever the sender felt like sending. Untouched ground.

Category claim (permanent, verifiable): the first payment tag that settles in tokenized stocks.

2. How it works

1. **Point your tag.** Own or register a tag in the chain's tag registry; set your receive-mix (any blend of registry-verified assets: tokenized equities/ETFs, USDG, tokenized metals; percentages totaling 100).
2. **Share it everywhere.** Bio, invoice footer, stream overlay, storefront QR. Anyone pays the tag in any token they hold.
3. **It lands converted.** The TagioFi settlement contract resolves the tag, honors the mix, swaps within strict slippage and Chainlink price-sanity bounds, and delivers to your wallet — one atomic flow, nothing custodied, ever.
4. **Teams too.** A tag with splits pays each member their share **in their own mix** — one client payment, four people, four different portfolios. A payroll vault runs the roster on schedule.

3. The field, and where they stop short

	Closed payroll pilots	Wallet swap features	Fee-drip stock tokens	TagioFi
Who gets paid this way	One company's staff	Nobody (buy-only)	Passive holders	Anyone with a tag
Asset choice	Single fund	n/a	Curated for you	Your mix, your call
Works for commerce/invoices	No	No	No	Yes — that's the point

The line for the thread: *"Your paycheck shouldn't need a second transaction to become your portfolio."*

4. Everyone has a seat

Who	Does	Gets
Earners	Sets a receive-mix on their tag	Every payment auto-builds their book
Payer	Pays a tag with whatever they hold	Zero-thought sending

Crew / DAO	Split tags + payroll vault	Whole-roster salary-in-assets
\$TGIO staker	Backs the registry/params	Share of settlement fees

5. \$TGIO

Bounded settlement fee on converted volume + payroll tiers → open-market \$TGIO buyback + staker distribution (80/10/5/5). Same-asset payments are permanently free — the rail grows first, the conversion monetizes.

6. Straight talk

- Receive-mixes draw only from the verified registry (canonical, liquid); RHC Stock Tokens are debt securities, region-gated, unavailable to US persons — disclosed at mix-setup.
- A leg that can't fill within bounds arrives as USDG with an on-chain notice. Payments complete; they never fill ugly or strand.
- No balances held, no custody, no payroll/tax function — employers plug in at their own compliance layer.

7. Shipping order

Phase	Ships
1	Tag receive-mixes + single-recipient settlement + verified-asset gate
2	Split tags (per-member mixes) + invoices/pay-links/QR
3	Payroll vault + \$TGIO genesis
4	Verified-social tag payments + cross-chain pay-in

Kill/persist: Phase 1 is the claim and a complete product. If conversion volume lags at day 30, lead with the payroll-vault B2B lane and keep the rail as infrastructure.
